ML HW4

Problem 1

1. Since I can fit a line that goes straight through them, the eigen vector would be the unit vector that goes through them. $[3,4]$ normalize into $[3,4] / \sqrt{3^2 + 4^2} = [3/5, 4/5]$

- 2.
- $$z1 = [-3, -4] \cdot [3/5, 4/5] = -5$$
- $$z2 = [0, 0] \cdot [3/5, 4/5] = 0$$
- $$z3 = [3, 4] \cdot [3/5, 4/5] = 5$$
- $$\text{mean} = (-5 + 0 + 5) / 3 = 0$$
- $$\text{variance} = 1/3 (25 + 0 + 25) = 50/3$$

3.

The follow graph is a line that best fit the three points. Since the line fits the points perfectly, there will be no reconstruction error.

Problem 2

1.

$$\prod_j \sum_{i=1}^k \frac{1}{\sqrt{(2\pi)^m |\Sigma_i|}} \exp\left(-\frac{1}{2}(x^j - \mu_i)^T (\Sigma_i)^{-1} (x^j - \mu_i)\right) p_i$$

- 2.
- $$p1 = (1 + .4 + 0) / 3 = 0.467$$
- $$p2 = (0 + 0.6 + 1)/3 = 0.533$$

- 3.
- $$\mu1 = (1 * 1 + 0.4 * 10 + 0 * 20) / 1.4 = 3.57$$
- $$\mu2 = (0 * 1 + 0.6 * 10 + 1 * 20) / 1.6 = 16.25$$

4.

$$\sigma_1 = (1 * (1 - 3.57)^2 + 0.4 * (10 - 3.57)^2) / 1.4 = 16.531$$

$$\sigma_2 = (0.6 * (10 - 16.25)^2 + 1 * (20 - 16.25)^2) / 1.6 = 23.4375$$

E Step

1.

$$P(y = c | x^i) \propto \frac{1}{\sqrt{(2\pi)^3 |\sum_c|)}} \exp\left(-\frac{1}{2}(x^j - \mu_c)^T \left(\sum_c\right)^{-1} (x^j - \mu_c)\right) p_c$$

2. $P(x_1 \text{ in } G_1) = 1/(\sqrt{(2\pi)^3 * 16.531}) \exp(-(1-3.57)^2/(2*16.531)) * 0.467 = 0.00597$
 $P(x_1 \text{ in } G_2) = 1/(\sqrt{(2\pi)^3 * 23.4375}) \exp(-(1-16.25)^2/(2*23.4375)) * 0.533 = 0.000049$
 $p(x_1) = [.992, .008]$
 $P(x_2 \text{ in } G_1) = 1/(\sqrt{(2\pi)^3 * 16.531}) \exp(-(10-3.57)^2/(2*16.531)) * 0.467 = 0.002088$
 $P(x_2 \text{ in } G_2) = 1/(\sqrt{(2\pi)^3 * 23.4375}) \exp(-(10-16.25)^2/(2*23.4375)) * 0.533 = 0.00304$
 $p(x_2) = [.407, .593]$
 $P(x_3 \text{ in } G_1) = 1/(\sqrt{(2\pi)^3 * 16.531}) \exp(-(20-3.57)^2/(2*16.531)) * 0.467 = 0.00000207475$
 $P(x_3 \text{ in } G_2) = 1/(\sqrt{(2\pi)^3 * 23.4375}) \exp(-(20-16.25)^2/(2*23.4375)) * 0.533 = 0.0052$
 $p(x_3) = [.0004, .9996]$

R = [.992, .008;
 .407, .593;
 .0004, .9996]
